# Optical Coherence Tomography for examination of stratigraphy of easel paintings

<sup>1</sup>*Institute for the Study, Restoration and Conservation of Cultural Heritage*

<sup>2</sup>*Institute of Physics*

Nicolaus Copernicus University, Toruń – Poland

# Invasive vs noninvasive examination

sample examination (invasive)

~1mm

up to 20 mm

OCT tomogram (noninvasive)

# The SOCT instrument

- Central wavelength: 840 nm
- Bandwidth (FWHM): 50 nm
- Very low irradiation: 200 – 800  $\mu\text{W}$
- Axial (in-depth) resolution  $\Delta z = 9 \mu\text{m}$  (in media)
- Transverse resolution  $\Delta x \sim 15 \mu\text{m}$
- Sensitivity: 108 dB A/D conversion: 12 bits
- Acquisition rate:
  - 40  $\mu\text{s}$ /A-scan
  - 0.2 s / 2D image (cross section, 5000 A-scans)
  - OCT movie: 16 frames/s x 1200 A-scans
  - real time monitoring: 2 frames/s x 400 A-scans

# Is the sample representative?

8 mm

average  
sample size  
 $\sim 1$  mm

# Examined oil paintings

*Saint Leonard*  
(XVIIIth c.)

*Virgin and Child*  
(XVIIIth c.?)

*Virgin and Child*  
(XIXth c.)

# Multi-layered varnish

photo: Z. Roziucka, Ph.D.

UV fluorescence

up to four layers of varnish visible in the tomogram

# Authentication of layers

photo: Z. Rozlucka, Ph.D.

partial overpainting lying on the varnish

# Authentication of layers

glazes under homogeneous varnish layer

right and left part of the tomogram are unlike – which may indicate different time of their origin

The advise from Dr Elżbieta Szmit-Naud is gratefully acknowledged

# Authentication/condition of layers

surface defect  
caused by  
mechanical  
abrasion

microscopic examination shows as if the damage was limited only to the uppermost, thick brownish layer

the OCT proves more - an internal crack at boundary between two varnish/glaze layers, which may suggest that they do not come from the same period

The advise from Dr Elżbieta Szmit-Naud is gratefully acknowledged

# Discoloration of glazes

VIS

UV fluorescence

photo: D. Mausolf, W. Grzesik

in some cases UV/VIS examinations give confusing results – areas with no visible pigment give strong UV fluorescence

# Discoloration of glazes

Oct4art: Toruń, 3-5 July 2008

VIS

UV

virtual  
reconstruction

the OCT examination reveals a discoloured glaze layer  
(thicker between arrows)

# Monitoring of overpainting removal

trials of overpainting removal with different solvent compositions; results evaluated traditionally and by means of the OCT

# OCT for artwork stratigraphy - summary

- **painting's technique, condition, and history**
  - o sequence and character of varnish and glaze layers:
    - o number of varnish/glaze layers
    - o existence of overpaintings
    - o discolouration of glaze layers
  - o volume rendering – 3D maps and profilometry
- **treatment monitoring:**
  - o varnish/overpainting removal by traditional means
  - o monitoring of laser ablation of varnish
