Into the 21st Century

- **6. 5 September 2000 Discovery of the Higgs Boson?**
- "We all hope that what we are seeing is the Higgs on the horizon," concluded Chris Tully of Princeton University to a packed CERN auditorium this morning.
- Tully and co-workers have combined the data of four experiments at LEP and found evidence that the Higgs boson has a mass of 114.9GeV c^{-2}.
- Again this is not the End of Physics - Physics is just beginning!
